Give a brief summary of plans for the next year of support, including the objectives and specific aims as well as the methodology to be used to achier these aims. DO NOT EXCEED THE SPACE PROVIDED.

Utilizing the approach proposed in the original proposal, we isolated 16 cDNA clones; 9 from T helper (Th) and 7 from cytolytic (CTL) T cells. Each clone was T cell specific and expressed preferentially in Th or CTL. One from Th corresponded to pro-opiomelanocortin and one from CTL corresponded to serine esterase-like molecule. The other 14 cDNA sequences have not been previously reported. In the next year our primary objective will be to characterize and identify the molecules corresponding to the 14 cDNA inserts. Specific aims include isolation of full length cDNA inserts for each of the 14 cDNAs, determination of the nucleotide sequence, and elucidation of the primary structure of the proteins. We will rescreen Th (L_2) and CTL (L_2) cDNA libraries which we have earlier prepared in Agt10 and Agt11 vectors, using each of the cDNA inserts as a probe. The cDNA inserts whose sizes are similar to that of corresponding mRNA will be selected. The nucleotide sequence of the full length cDNA inserts for each of the clones will be determined by dideoxy chain termination method after cloning into M13 vectors. The deduced amino acid sequence will be determined and characterized as to whether the molecules are secretory or nonsecretory. This will help predict their more exact roles in helper or cytolytic T-cell activities.

CDNA Analysis for Subset-Specific T-cell Gene Expression (SEE INSTRUCTIONS)

1. No change.

cDNA libraries were prepared from cloned murine helper (Th) and cytolytic (CTL) T lymphocytes. Both negative and positive differential screening and RNA blot analysis were used to identify clones which were T-cell specific and expressed preferentially in Th or CTL. Seven clones corresponded to previously described T cell genes, and 16 additional cDNA clones were isolated, 9 from Th and 7 from CTL cells. Of these clones 3 were expressed in both Th and CTL, 7 were expressed in only Th and 6 only in CTL. The 16 cDNA inserts were cloned into M13 vector mp8 and their partial nucleotide sequence was determined. nucleotide sequence of each cDNA was compared with sequences in the Gene Bank and with cDNA sequences from CTL or Th which have been published recently. One gene from CTL was homologous to a serine esterase-like sequence (Gershenfeld and Weissman, Science 232:854, 1986) and one gene from Th proved to be identical to pro-opiomelanocortin. The other 14 cDNA sequences were not previously reported. Next, these clones were analyzed for induction by IL-2 or T cell antigen receptor stimulation. Three different patterns of expression were documented: 1) inducible only by ConA; 2) inducible by ConA and IL-2; and 3) inducible by ConA and T cell antigen receptor stimulation. The detailed work is described in an accompanying manuscript entitled, "Isolation and initial characterization of multiple species of T lymphocyte subset cDNA clones". The protocol for differential screening of a cDNA library which we developed will be generally applicable to a situation where a preselected cDNA library is undesirable. Characterization of Th- or CTL-specific cDNA clones, which we have isolated, will lead to the discovery of as yet unknown roles for T cell subsets in the immune responses and to better definition of the pathways of T-cell activation process.

- To isolate full length cDNA inserts for each of the 14 novel cDNAs which are T cell-specific and expressed preferentially in Th or CTL.
 - b) To determine entire nucleotide sequence of as many as possible of the full length cDNA inserts .
 - c) To demonstrate the primary structure of the proteins corresponding to the novel cDNA inserts.
